

# The Role of Equity Financing Constraints in the Transmission of Monetary Policy

Heitor Almeida   Timothy Johnson   Sebastiao Oliveira   Yucheng Zhou

University of Illinois at Urbana-Champaign

November 12, 2024

# Motivation

- Literature has found monetary policy impacts real economy in various ways
  - Key finding: contractionary shocks lead to  $\downarrow$  investment at aggregate and firm level
- Financial accelerator is a potential channel
  - Firms foregoes positive NPV projects due to lack of financing
- MP  $\rightarrow$  interest rate  $\rightarrow$  cost of capital  $\rightarrow$  constraint binding  $\rightarrow$  investment
  - Financial constraint could amplify the impact of monetary policy
- Literature has focused on debt-related constraints ("*debt channel*"): leverage, age/size (collateral value), debt maturity (refinancing constraints)
  - Leverage is found to dampen the response of investment to MP in *Ottonello and Winberry (2020)*, but neutral in *Cao et al. (2023)*
  - Ozdagli (2017) finds that leverage is amplifying the response of stock prices to MP

# Motivation

- It is not clear about firms relying on equity financing
  - Financial constrained firms might turn to equity financing for liquidity needs
- *Beyhaghi et. al. (2024)* show firms could issue equity to alleviate negative impact of contractionary shocks
- What if these firms have difficulty in raising equity?
  - They could be more sensitive as MP could also affect the cost of equity
- They rely on equity financing on the margin, changes in the cost of equity may be an important mechanism
  - Monetary policy may not transmit only through its impact on debt financing terms

# This Paper

- What is the role of equity financing constraints in the transmission of monetary policy to the corporate sector?
  - Distinguish between financial constraint on equity (*FCE*) or debt (*FCD*) financing
  - A comprehensive analysis of the heterogeneous responses to MP
    - Stock price, investment policies, innovation output, and financing policies
    - Estimation of sensitivity are isolated from the Fed “information effect”
- ⇒ *Equity channel* of monetary policy transmission
- Monetary policy could transmit through its impact on equity financing terms

## Main Results

- Contractionary shocks lead to ↓ stock price, CAPX, R&D, and patents

# Main Results

- Contractionary shocks lead to ↓ stock price, CAPX, R&D, and patents
- Firms with high *FCE* show a much larger decrease than unconstrained firms do
  - *FCE* significantly amplifies responses to MP (*equity channel*)

# Main Results

- Contractionary shocks lead to ↓ stock price, CAPX, R&D, and patents
- Firms with high *FCE* show a much larger decrease than unconstrained firms do
  - *FCE* significantly amplifies responses to MP (*equity channel*)
- Equity channel is dominant in the heterogeneous transmission of monetary policy
  - It prevails after controlling for the “debt channel” and other debt-related characteristics
  - *FCD* magnifies with a much smaller economic magnitude

# Main Results

- Contractionary shocks lead to ↓ stock price, CAPX, R&D, and patents
- Firms with high *FCE* show a much larger decrease than unconstrained firms do
  - *FCE* significantly amplifies responses to MP (*equity channel*)
- Equity channel is dominant in the heterogeneous transmission of monetary policy
  - It prevails after controlling for the “debt channel” and other debt-related characteristics
  - *FCD* magnifies with a much smaller economic magnitude
- Equity channel is supported by financing/issuance policies
  - Firms with high *FCE* issue much less equity after contractionary shocks

# Literature Review

- Monetary policy transmission to investment
  - *Bernanke et. al. (1999), Fazzari et. al. (1988), Gertler and Gilchrist (1994), Ippolito et. al. (2018), Ottonello and Winberry (2020), Jeenas (2019), Lakdawala et. al. (2021), Durante et al. (2022), Cao et. al. (2023), Cloyne et al. (2023) ...*
  - Equity channel matters more, and it plays a potentially critical role for the long-term growth due to its impact on R&D and innovation
- The effect of monetary policy on stock market
  - *Bernanke and Kuttner (2005), Lamont et al. (2001), Ozdagli (2017), Chava and Hsu (2020), Bianchi et al. (2022), Pflueger and Rinaldi (2022), Kekre and Lenel (2022), Bauer and Swanson (2023) ...*
  - Financing constraints and capital structure affect stock price sensitivity to MP, consistent with the financial accelerator mechanism
- The role of equity in the transmission of monetary policy
  - *Beyhaghi et. al. (2024), Jeenas and Lagos (2024)*
  - Constraint in accessing equity financing has an amplification effect to MP

# Data

## Firm-level Data

- Text-based measure of financial constraint
- COMPUSTAT Quarterly: Balance sheet information
- CRSP Daily: Stock return
- SDC Platinum: SEO issuance
- USPTO: Patent filings
- Sample period: 1991-2019

▶ [summary statistics](#)

# Financial Constraint Measure

- A firm is considered equity-focused constrained if it mentions in 10-K that
  - its investments/projects get “*abandon*”, “*curtail*”, or “*postpone*” etc.
  - AND it intends to issue “*equity*” financing for liquidity needs ▶ [example](#)
- Debt-focused constraint is defined in a similar way but the firm attempts to issue “*debt*” financing
- Each firm-year is given a continuous score on each dimension, constructed from similarity of the text in each firm’s 10-K with firms identified as constrained
  - Constructed by *Hoberg and Maksimovic (2015)*, extended by *Linn and Weagley (2023)*
  - LW2023 also show this measure can better capture financial constraint behavior, than traditional accounting measures

# Financial Constraint Measure

- *FCE* and *FCD* denote equity-focused and debt-focused constraint, respectively
- We sort firms into terciles each year on each dimension, end up with 9 groups
- Focus on these two
  - FCE firms: firms that are in the top tercile of *FCE* and in the bottom tercile of *FCD*
  - FCD firms: firms that are in the top tercile of *FCD* and in the bottom tercile of *FCE*
- To isolate the effect of *FCE* and control for the other dimension *FCD*

▶ comparison

## Summary Statistics by Groups

|               | Equity-Focused Constrained Firms |       |           | Debt-Focused Constrained Firms |       |           | Unconstrained Firms |       |           |
|---------------|----------------------------------|-------|-----------|--------------------------------|-------|-----------|---------------------|-------|-----------|
|               | Obs                              | Mean  | Std. dev. | Obs                            | Mean  | Std. dev. | Obs                 | Mean  | Std. dev. |

# Identification of Monetary Policy Shocks

- We employ a high frequency identification (HFI) strategy to construct *mps*
  - Following *Gürkaynak, Sack, and Swanson (2005)* and *Bernanke and Kuttner (2005)*
- The price change of Fed Funds Rate futures contracts in the 30-minute window around the FOMC announcement
  - It captures market-based unexpected changes in the Federal funds rate
- Identifying assumption: this narrow window contains no other information that may affect the interest rate expectations

# Separate “Pure” Monetary Policy Shocks

- Fed “Information effect”: an unexpected monetary tightening might be interpreted as a signal of a strong economy
- Follow *Jarocinski and Karadi (2020)* to separate the “pure” *mps* ▶ [figure and sum stats](#)
- Conceptually simple exercise
  - “Pure” *mps*: leads to negative comovement between stock price and interest rate expectations
  - “Information” shock: leads to positive comovement between stock price and interest rate expectations

# Methodology and Results

# Stock Price Response

$$r_{ij,t} = \alpha + \beta mps_t + \gamma l_{ij,t} + \delta [mps_t \times l_{ij,t}] + Controls_{ij,t} + FE_{j,y} + e_{ij,t}$$

- $r_{ij,t}$ : daily stock returns of firm  $i$  in industry  $j$  on day of FOMC announcement  $t$
- $mps_t$ : standardized “pure” monetary policy shock
- $l_{ij,t}$ : 1 if in the group of (lagged)  $FCE$ , 0 otherwise
  - Other groups are included in the regression, except for unconstrained group
- $\delta$ : response to  $mps$  (standardized) of  $FCE$  firms relative to unconstrained firms
- Controls: size, book-to-market, leverage, profitability, cash holding, and their interactions with  $mps$ , industry-year FE
- Return window: (0, 0), (+1, +1), (+2, +2), (0, +1), (0, +2), (0, +5) ▶ average response

## Heterogeneous Stock Price Response

| Window:                      | (0,0)<br>(1)         | (+1,+1)<br>(2)    | (+2,+2)<br>(3)       |
|------------------------------|----------------------|-------------------|----------------------|
| $mps \times equity\_focused$ | -0.179***<br>(0.039) | -0.026<br>(0.041) | -0.119***<br>(0.038) |
| $mps \times debt\_focused$   | -0.110***<br>(0.032) | 0.035<br>(0.033)  | -0.102***<br>(0.030) |
| Observations                 | 844,031              | 795,949           | 728,257              |
| R <sup>2</sup>               | 0.020                | 0.016             | 0.015                |
| Industry-year FE             | Yes                  | Yes               | Yes                  |
| Firm Controls                | Yes                  | Yes               | Yes                  |

- One unit of shock (6bps) leads to 17.9bps lower return for *FCE* firms relative to unconstrained firms
- 11bps lower return for *FCD* firms on the day of FOMC

## Equity Channel Amplifies Stock Price Response

| Cumulative Window:           | (0,+1)<br>(1)        | (0,+2)<br>(2)        | (0,+5)<br>(3)        |
|------------------------------|----------------------|----------------------|----------------------|
| $mps \times equity\_focused$ | -0.201***<br>(0.055) | -0.292***<br>(0.063) | -0.481***<br>(0.081) |
| $mps \times debt\_focused$   | -0.077*<br>(0.043)   | -0.183***<br>(0.048) | -0.153**<br>(0.062)  |
| Observations                 | 843,764              | 843,501              | 842,718              |
| R <sup>2</sup>               | 0.025                | 0.023                | 0.030                |
| Industry-year FE             | Yes                  | Yes                  | Yes                  |
| Firm Controls                | Yes                  | Yes                  | Yes                  |

- One unit of shock (6bps) leads to 48.1bps lower return for *FCE* firms relative to unconstrained firms
- 15.3bps lower return for *FCD* firms in the 5-day cumulative window
- For comparison, average stock price response in the 5-day window is 1.05%

# Investment Policy

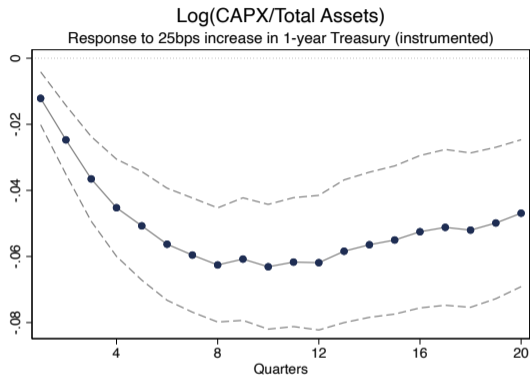

- Instrumental variable local projection for impulse response functions
  - 1-year Treasury rate instrumented by *mps*, controlling for macroeconomic variables (*Dottling and Ratnovski, 2023*) ▶ [first stage](#)
- The instrumented 1-year Treasury rate ( $\hat{y}t$ ) represents the monetary policy stance which firms make decisions on ▶ [figure](#)
  - Because the adjustment of investment policy is slow-moving, with long and uncertain lags, and measured at quarterly frequency
  - The economy was in ZLB for a long time (*Gertler and Karadi, 2015*)

# Investment Policy

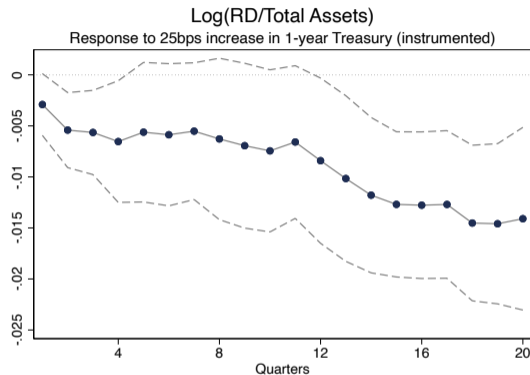

$$\begin{aligned} y_{ij,t+h} - y_{ij,t-1} = & \beta_1^h FCE_{ij,t-1} + \beta_2^h FCD_{ij,t-1} \\ & + \beta_3^h FCE_{ij,t-1} \times \hat{y}t_t + \beta_4^h FCD_{ij,t-1} \times \hat{y}t_t \\ & + \gamma_1^{h'} Z_{ij,t-1} \times \hat{y}t_t + \gamma_2^{h'} Z_{ij,t-1} + \alpha_i + \eta_{jt} + \mu_{fq} + \epsilon_{ij,t} \end{aligned}$$

- $y_{ij,t+h}$ : CAPX or R&D in logs at  $h$  quarters after the *mps* at time  $t$  for firm  $i$  in industry  $j$
- $\hat{y}t$ : instrumented 1-year Treasury rate
- $\beta_3^h$  and  $\beta_4^h$ : the heterogeneous impulse response to *mps*
- Firm level controls and their interactions with  $\hat{y}t$ , firm FE, fiscal quarter FE, and industry-time FE

# Average Response: CAPX and R&D

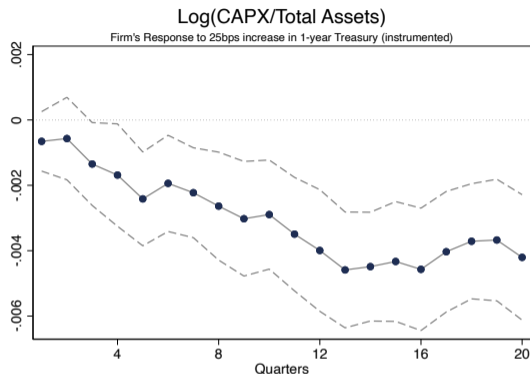

CAPX

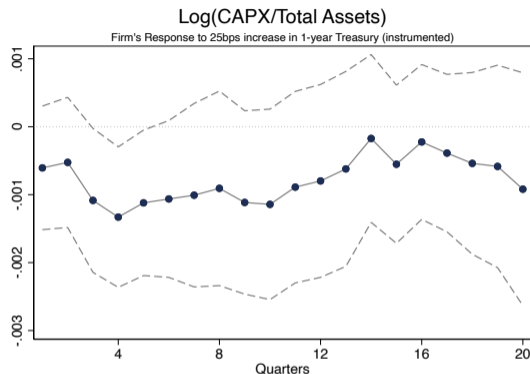

R&D

- 25bps higher rate leads to ↓ CAPX by 5.2% and R&D by 1.3% over 3-5 years

# FCE Amplifies Response of CAPX

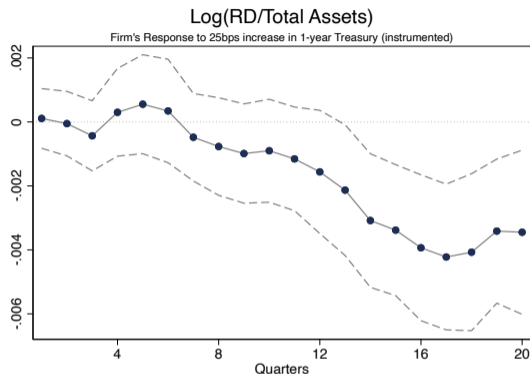

*FCE*

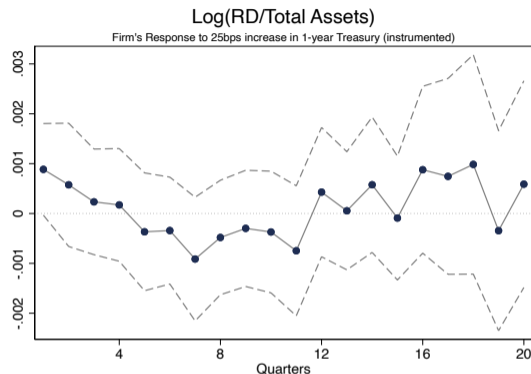

*FCD*

- One s.d. increase in *FCE*: 5% amplification relative to the average response
- One s.d. increase in *FCD*: 1.5% amplification relative to the average response

# FCE Amplifies Response of R&D

*FCE*

*FCD*

- One s.d. increase in *FCE*: 17% amplification relative to the average response
- No amplification effect of *FCD* on R&D ▶ [robustness](#)

## Impact Translated into Patents

|                        | Log(Number of Patents Filed) |                      |
|------------------------|------------------------------|----------------------|
|                        | $h = 17$                     | $h = 20$             |
| $mps \times FCE$       | -0.011*<br>(0.006)           | -0.017***<br>(0.006) |
| $mps \times FCD$       | -0.003<br>(0.007)            | -0.004<br>(0.007)    |
| Observations           | 39,634                       | 36,079               |
| Firm Controls          | Yes                          | Yes                  |
| Firm FE                | Yes                          | Yes                  |
| Fiscal Quarter FE      | Yes                          | Yes                  |
| Industry $\times$ Time | Yes                          | Yes                  |

- One s.d. increase in *FCE*: 9.3% amplification relative to the average response
- No amplification effect of *FCD* on patents

## Impact Translated into Patents

|                        | Log(Number of Patents Filed) |                      |
|------------------------|------------------------------|----------------------|
|                        | $h = 17$                     | $h = 20$             |
| $mps \times FCE$       | -0.011*<br>(0.006)           | -0.017***<br>(0.006) |
| $mps \times FCD$       | -0.003<br>(0.007)            | -0.004<br>(0.007)    |
| Observations           | 39,634                       | 36,079               |
| Firm Controls          | Yes                          | Yes                  |
| Firm FE                | Yes                          | Yes                  |
| Fiscal Quarter FE      | Yes                          | Yes                  |
| Industry $\times$ Time | Yes                          | Yes                  |

- Equity channel is potentially important for long-term growth

## Financing Decisions

- If the equity channel is quantitatively important, *FCE* firms might issue less equity after contractionary shocks

$$\Delta y_{ij,t} = \beta_1 \times \hat{y}t_t + \beta_2 \times l_{ij,t} + \beta_3 \times l_{ij,t} \times \hat{y}t_t + \gamma_1 \times Z_{ij,t-1} \\ + \gamma_2 \times X_{t-1} + \alpha_i + \mu_{fq} + \lambda_{q,j} + \epsilon_{it}$$

- $y_{ij,t}$ : equity, public SEO, and debt issuance scaled by assets at time  $t$  for firm  $i$  in industry  $j$
- $\hat{y}t$ : instrumented 1-year Treasury rate
- $l_{ij,t}$ : 1 if in the group of (lagged) *FCE*, 0 otherwise
  - Other groups are included in the regression, except for unconstrained group
- $\beta_3$  captures the heterogeneous response to *mps* relative to unconstrained firms
- Firm level controls and their interactions with  $\hat{y}t$ , firm FE, fiscal quarter FE, and industry-time FE

## Financing Decisions Support the Equity Channel

|                                    | Equity issuance<br>(1) | Public SEO issuance<br>(2) | Debt issuance<br>(3) |
|------------------------------------|------------------------|----------------------------|----------------------|
| <i>mps</i>                         | -0.0024***<br>(0.0005) | -0.001*<br>(0.0006)        | -0.0002<br>(0.0004)  |
| <i>mps</i> × <i>equity_focused</i> | -0.0023***<br>(0.0007) | -0.002***<br>(0.0007)      | -0.001**<br>(0.0004) |

- Contractionary shocks lead to  $\downarrow$  cash holdings
- *FCE* firms are reluctant to run down cash holding (precautionary), likely due to increased difficulty in raising new equity to replenish cash (*McLean, 2011*)
- Help explain why *FCE* firms cut real investments by more than other firms

# Rule Out Debt Channel

- *FCE* firms issue less debt after a contractionary shock, albeit to a lesser extent
- Potential concern: transmission could still operate through the debt channel
- How do we rule out
  - Estimate the impact of financing shocks on investment policies
  - Aggregate level financing shocks in equity (*EIS*) and debt (*DIS*) markets from *Belo et. al. 2024* ▶ [financing shock](#)
  - Interaction of these shocks with *FCE* and *FCD* firms
- If investment policies of *FCE* firms mainly react to *EIS* NOT *DIS*
  - It is unlikely MP affects *FCE* firms' investment decisions via the debt channel

## Rule Out Debt Channel

$$y_{ij,t+h} - y_{ij,t-1} = \beta_1^h FCE_{ij,t-1} + \beta_2^h FCE_{ij,t-1} \times EIS_t + \beta_3^h FCE_{ij,t-1} \times DIS_t \\ + \gamma_1^{h'} Z_{ij,t-1} \times EIS_t + \gamma_2^{h'} Z_{ij,t-1} \times DIS_t + \gamma_3^{h'} Z_{ij,t-1} + \alpha_i + \eta_{jt} + \epsilon_{ij,t}$$

- $y_{ij,t+h}$ : CAPX or R&D in logs at  $h$  quarters after the  $EIS$  or  $DIS$  at time  $t$  for firm  $i$  in industry  $j$
- $EIS$  and  $DIS$ : aggregate level financing shocks in equity and debt markets
- $\beta_2^h (> 0)$  and  $\beta_3^h (\approx 0)$ : relative impulse response of  $FCE$  to  $EIS$  and  $DIS$ 
  - $FCD$  and its interactions with  $EIS$  and  $DIS$  are also included in the regression
- Firm level controls and their interactions with  $\hat{y}t$ , as well as firm, fiscal quarter, and industry-time FE

- Shocks in equity market affect the investment of *FCE* firms
- The impact of debt market shocks is not significant  $\rightarrow$  unlikely transmission of monetary policy operates through the debt channel

# Conclusion

# Conclusion

- We provide new evidence that equity channel is quantitatively important in the heterogeneous transmission of monetary policy
- After a contractionary monetary policy shock, equity-focused constrained firms
  - Decrease significantly more CAPX and R&D than unconstrained firms do
  - Such decrease in investment is translated into innovation output
  - It is also reflected in stock price responses
- The equity channel is supported by the financing policies
  - These firms cut equity issuance by a significant magnitude and are reluctant to run down cash holdings
- The findings hold robustly after accounting for debt-focused constraint and other debt-related firm attributes

# Appendix

## Example: AMERIGON INC

- ...Should the Company not achieve profitability in the near future from the two abovementioned products, additional **equity financing** would be required. If additional funds are not obtained when needed, the Company will be required to significantly **curtail** its development activities, dispose of one or more of its technologies and/or cease operations and liquidate ...

## Financing Shock from *Belo et. al. (2024)*

- Using micro moments, *Belo et. al. (2024)* measure the aggregate shocks to firms' equity and debt issuances as the unexpected change in the fractions of firms issuing equity and debt in the cross-section, after accounting for standard observable proxies that influence firm's issuance activity
- They model these fractions as autoregressive processes and include several aggregate variables to control for investment opportunities, and costs of equity and debt financing, thus capturing the expected normal variation in issuance activity
- The Equity Issuance Shocks (EIS) and Debt Issuance Shocks (DIS) are the residuals from these regressions
- That way, there are two financial shocks from the time series variation in the fractions of firms issuing equity and debt in the cross-section of U.S. publicly traded firms
